

Mixbook achieves “high level of confidence” in AWS monitoring

ABOUT

Industry

SaaS, E-commerce

Headquarters

Redwood City, CA, USA

OBJECTIVE

Automate infrastructure monitoring to meet the demand of a diverse and highly scalable environment.

SUCCESS

Monitoring that automatically learns the behavior of metrics and newly added resources.

ABOUT:

Mixbook

Founded in 2006, Mixbook offers a convenient, web-based platform where users can design and order personalized photo products. As the company operates in a market where delivering a superlative user experience is paramount for retaining customers and growing its business, guaranteeing the availability and optimizing the performance of Mixbook's applications and infrastructure is a critical priority for the company's IT team.

Initially, Mixbook relied on extensive manual monitoring, combined with primitive alerting features from the company's cloud provider to manage the infrastructure that powers its applications. However, after considering other leading commercial monitoring solutions, the Mixbook IT team settled on CloudWisdom to overhaul its monitoring workflow.

Inevitably, I'd discover that we didn't monitor something appropriately, and [it] was close to failing."

Robert Butler

Senior DevOps Engineer,
Uptime Lead and Product Owner

The CloudWisdom team was very interested in supporting monitoring in a way that aligns very well with cloud-native technologies.”

THE CHALLENGE:

Managing Rapidly Changing AWS Infrastructure

Mixbook's software is deployed entirely in the AWS cloud using a combination of EC2 instances, S3 storage, RDS databases, and Docker containers. This mix of AWS resources is not only diverse, but also has high scalability requirements. Mixbook's typical deployment, measured in number of hosts, can triple or quadruple during periods of peak demand for the company's photo products, such as in the weeks preceding holidays. When Mixbook first migrated its infrastructure to the AWS cloud about five years ago, its IT team relied primarily on CloudWatch's monitoring features. Although CloudWatch's integration into AWS made it convenient to use in some respects, the tool was not sufficient on its own for achieving the streamlined, highly automated monitoring workflows that Mixbook sought, according to Robert Butler, Senior DevOps Engineer, Uptime Lead and Product Owner at Mixbook. CloudWatch requires engineers "to create an alarm for every single metric," Butler explained. "So if, for example, you create a new database for a new service, and you forget to set the CloudWatch alarm for that database, you could run out of disk space without having thought about it."

Because of the risk that an engineer might fail to set up a CloudWatch alarm and leave a resource essentially unmonitored, Butler and his team performed periodic manual reviews of their CloudWatch configuration. "Inevitably, I'd discover that we didn't monitor something appropriately, and [it] was close to failing," Butler said.

THE SOLUTION:

Automating Monitoring with Machine Learning and CloudWisdom

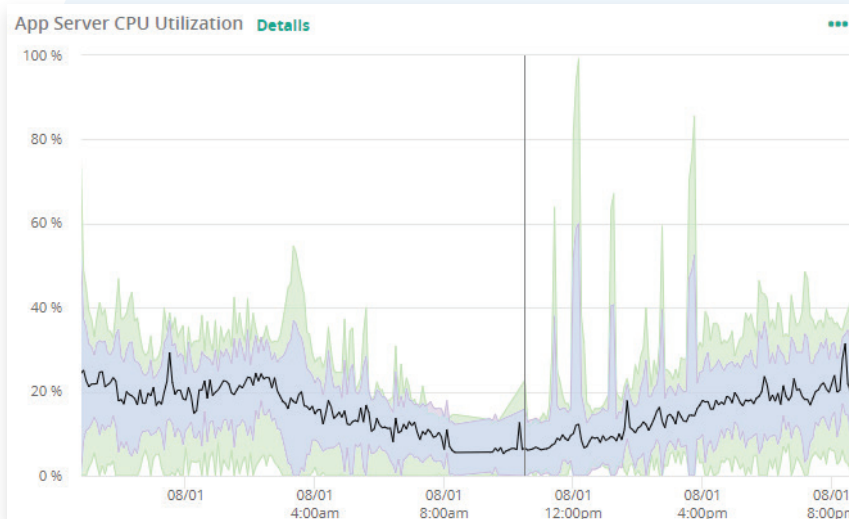

The inefficiency and risk associated with Mixbook's initial monitoring strategy led its IT team to begin exploring other options. They considered several commercial monitoring tools, but found most to lack either competitive pricing or the features necessary to streamline monitoring configurations. After Butler and his team evaluated CloudWisdom alongside a leading commercial tool in the market for several weeks, CloudWisdom stood out for three main reasons.

CloudWisdom
learns your metrics
and how they
deviate, also it
provides a really
powerful set of
rules for describing
the metrics you
want to monitor.”

+ Metric Condition: If the metric `aws.ec2.cpuutilization` has a **Baseline Upper Deviation**, and has a **Contextual Upper Deviation**, and is **More Than or Equal To 20**.

+ Metric Condition: If the metric `netuitive.aws.ec2.bytesinpersec` **Baseline Is Not Deviating**, and **Contextual Is Not Deviating**.

+ Metric Condition: If the metric `netuitive.aws.ec2.bytesoutpersec` **Baseline Is Not Deviating**, and **Contextual Is Not Deviating**.

Default Policy: AWS EC2 - Elevated CPU Activity (Normal
Network Activity) conditions

**Thanks to
CloudWisdom, I
have this really high
level of confidence
that no service is
being overlooked.”**

Uptime Lead and Product Owner

THE RESULT & FUTURE PLANS:

New AWS Services and Optimizing Costs

CloudWisdom has not only enabled Mixbook's IT team to optimize monitoring workflows for the company's existing cloud infrastructure, but is also giving Butler and his team the confidence they need to take advantage of new AWS services, such as AWS Fargate. The company has begun to deploy workloads on these services and plans to expand its use of them in the future, aided by the monitoring insights that CloudWisdom provides. "Now, with CloudWisdom, we're standing up a bunch of new AWS services," Butler said, explaining that CloudWisdom automatically monitors and learns the behavior of a new resource which has been added.

Thanks to CloudWisdom, "I have this really high level of confidence that no service is being overlooked," Butler said. In addition, Mixbook plans in the future to begin leveraging CloudWisdom's cost-management and optimization features to ensure that it is not overspending on cloud infrastructure. "I'm working on using CloudWisdom to replace our cost management," Butler explained. "We want to start using CloudWisdom for ongoing day-over-day, week-over-week, month-over-month, year-over-year cost analysis."
